

30 Year History- Standard & Poor's 500

The S & P 500 is an index of the prices of 500 large cap common stocks actively traded in the United States. It has been considered a bellwether for the American economy. The graph shows the historical performance of the S&P 500 from January 1980 to April 2009 revealing an average rate of growth of 7% (SEVEN PERCENT)

What can we learn from this wild journey?

1. To say, "Hold on...the market will come back" begs the question, BACK? BACK TO WHAT AND FOR HOW LONG? Do we need another *bubble* to get the S&P back to 1500 ?
2. The Technology Bubble and the Lending Bubble created two artificial stock market "Booms" followed by two severe market "corrections". The bubbles were conceived by and for Wall Street's private hedge fund get rich quick game. We weren't invited.
3. The "Monkey Business" at the banks and on Wall Street was concealed by the media and the government until it had become a crisis. The Federal Reserve refuses accountability.
4. Seeing that "cooking the books" is the norm on Wall Street, and that the media and the politicians are for sale, people are turning to the safety of guaranteed products to build and protect their savings. Wealth building strategies shouldn't be like a trip to Las Vegas.
5. There is a proven way to consistently average 5% to 7% right now on your savings with liquidity and guarantees. Jim Cramer, Suze Orman, and Dave Ramsey won't tell you about it. MAKE YOUR SAVINGS SAFE NOW. JUST ASK ME HOW.
